

Wi-Fi Perimeter Scanner

Select Fabricators' Wi-Fi Perimeter Scanner allows the user to easily detect an RF leak inside the RF/EMI Shielded Enclosure. The easy to use device will notify personnel with a visible signal if any Wi-Fi signals enter the enclosure. Never worry about doors closed improperly or IO panel mishaps again.

Maximum Defense

The Wi-Fi Perimeter Scanner will continuously scan the inside of the RF/EMI Shielded Enclosure for any 2.4 GHz or 5 GHz wireless signal when in use. The device is powered by a micro USB cable which is included with purchase. When installed using the Velcro attachment, the user will easily detect any notification.

Green Response

Upon completion of a scanning cycle, the Wi-Fi Perimeter Scanner will elicit a green response if both 2.4 Ghz and 5 Ghz wireless signals are clear from the Enclosure.

Red Response

If the Wi-Fi Perimeter Scanner detects any wireless signals during the scanning cycle, the device will elicit a strong red response. The red light will remain illuminated until the wireless signals have cleared from the RF/EMI Shielded Enclosure.

Applications

EMC Testing

Secure Communications

Vehicle Testing

Wireless Device Testing

Cryptocurrency Security
